Comprehensive Liver Evaluation

Advances in diagnostic imaging have surpassed the ability of biopsy to detect and quantify liver cirrhosis and fibrosis without the need for painful and invasive biopsies.

This new technique is called MR elastography and Rhode Island Medical Imaging (RIMI) is proud to be the only outpatient imaging facility in Rhode Island to offer this exam.

MR elastography adds approximately one minute to the time required for standard MRI of the liver. Performed together, MR elastography and MRI of the liver provide a one-stop shop comprehensive evaluation for fibrosis, cirrhosis and detection of liver tumors.

Patient Benefits:

- Non-invasive (no biopsy needed)
- Less expensive and faster than a biopsy

Referring Provider Benefits:

- Comprehensive liver evaluation in one exam
- Most accurate measurement of liver fibrosis
- Most sensitive detection of liver masses

Patient Profile and Exam Preparation:

- Any patient with known liver disease
- Patient must fast for 6 hours before the exam

For more information please visit
our website www.rimirad.com or call us
at 401.432.2400 to setup your exam.
